To summarize

- ✓ Modules and packages allow for code written by others to be easily imported and reused.
- ✓ NumPy arrays allow easily storing many numbers and performing operations without having to loop.
- ✓ Matplotlib can be used to generate many different types of plots.
- ✓ pandas DataFrames represent data in tables.
- ✓ Big projects have documentation to explain their functionality.

Now you are ready to:

- Import code from existing modules and packages.
- Use NumPy to easily process multidimensional data.
- Use Matplotlib to generate different types of plots to visualise data.
- Approach a new package and explore its documentation and examples.
